

STEPS TO PREVENT INFECTIONS

→ HOW INFECTIONS ARE TRANSMITTED

through the skin

PENETRATION ROUTE

on the skin's surface

through the mucous membranes of the eyes, nose, or mouth

MODE OF SPREAD

directly

indirectly

GERMS MAY BE FOUND in droplets sprayed through the air when someone coughs, in feces, or in blood.

WEAR GLOVES, if you risk coming into contact with blood, or when changing a diaper, if diarrhea is present.

REMOVE THEM AS SOON AS THE JOB IS DONE, or they will contaminate whatever they touch.

GASTROENTERITIS is spread by hands or objects contaminated with feces and then transferred to the mouth!

→ HAND WASHING

It is the most effective prevention method. Keep fingernails short, free of polish, and eliminate jewelry and artificial nails.

DON'T COUGH OR SNEEZE INTO YOUR HANDS

Use a tissue to cover your mouth and nose or cough or sneeze into your elbow or sleeve.

GET VACCINATED!

It protects you from illness and lowers the risk to everyone around you.

DISINFECT OFTEN:

taps, toilet flush handles, doorknobs, light switches, toys, etc.

Follow product directions on all cleaning products.
